

The inputs for all users are found in only three pages: comments, searching a contact and logging in. When a user views new targets there will always be an empty slot for StudentComment and ParentComment, while MentorComment may or may not be left blank by the mentor when they added the target. For each user, the comment is loaded in each target and displayed, along with the option to add, edit or delete their comment. When searching a contact the user is not required to actually enter any input data if their user type is already chosen. This is true for parents and mentors who can only search for students. Students who have one from either a parent or mentor, but not the other, will also have only the option to search for the user type they have no entry from. Students without either will be required to select which user type they are searching for. Other fields are optional. The user's first name, surname and ID are all available and with various methods of searching. Logging in requires three inputs: UserLogin, UserPassword and UserType. UserLogin is the user's login account, UserPassword is the password used to log into the account and UserType is essential in that the correct table is located before it is searched for a match.

Mentors also have other input roles, such as when they wish to add a meeting. Adding a meeting requires several inputs: the meeting day, meeting month and student. This is also true for editing a meeting. AddMeetingPage is the page used for adding a meeting. EditMeetingPage is the page used to edit a meeting. AddTargetPage is the page used to add a target to a meeting and EditTargetPage is used to edit an existing target to a meeting. AddTargetPage and EditTargetPage require the following inputs: TargetUserType, UserTarget, day, month and MentorComment. TargetUserType determines whether a student, parent or mentor is set this target. UserTarget is the actual target set for this user. The variables 'day' and 'month' are used for setting the date of the target. MentorComment is the variable used to add a mentor comment, if input so that the mentor's comment is added before the target is. EditTargetPage takes the existing details and enables the user to edit any of these with the same interface, with the addition of the option to set TargetMetYet, the variable used for setting whether a target is complete, to either 1 or 0. 0 is equivalent to 'No', while 1 is equivalent to 'Yes'. The other users' comments are also displayed.
